

Improving the Cost Effectiveness of Hazardous Materials Management Programs Aboard U.S. Navy Dock Landing Ships (LSDs)

This is a NAVAL POSTGRADUATE SCHOOL MONTEREY CA report procured by the Pentagon and made available for public release. It has been reproduced in the best form available to the Pentagon. It is not spiral-bound, but rather assembled with Velobinding in a soft, white linen cover. The Storming Media report number is A347113. The abstract provided by the Pentagon follows: This thesis analyzes the cost effectiveness of alternatives to the U. S. Navys current hazardous materials management practices onboard its ships. Numerous recent laws regarding pollution prevention aboard ships as well as significant reductions in Department of Defense spending has led the Navy to seek initiatives to manage hazardous materials in a more efficient and cost effective manner. This thesis deals with reducing wastestream volume and costs and improving the management of the Hazardous Minimization Centers (HMCs). Research was conducted onboard seven U.S. Navy Dock Landing Ships (LSDs): USS ANCHORAGE, USS COMSTOCK, USS FORT FISHER, USS FORT MCHENRY, USS HARPERS FERRY, USS MOUNT VERNON and USS RUSHMORE. Hazardous material wastestream data was gathered for each ship to determine the significant material contributors to disposal costs. Additionally, information was accumulated concerning the training received by HMC operators to identify potential management weaknesses. Research identified significant cost savings by replacing the currently used baled wiping rags with shop towels provided by a contracted commercial vendor. Also noted was the fact that HMC operators were not receiving the requisite training required to properly manage HMCs. Therefore, training alternatives are addressed to ensure competent management of HMCs.
