

The Construction of Logical Space

Our conception of logical space is the set of distinctions we use to navigate the world. In *The Construction of Logical Space* Agustín Rayo defends the idea that one's conception of logical space is shaped by one's acceptance or rejection of just is-statements: statements like to be composed of water just is to be composed of H₂O, or for the number of the dinosaurs to be zero just is for there to be no dinosaurs. The resulting picture is used to articulate a conception of metaphysical possibility that does not depend on a reduction of the modal to the non-modal, and to develop a trivialist philosophy of mathematics, according to which the truths of pure mathematics have trivial truth-conditions.
