

# Thyroid Hormones and the Tests that Monitor Them: Hormonal Functions, Imbalances and Treatments

The metabolism of the body is regulated by thyroid hormones. These include the T-4, T-3, Reverse T-3 and TSH (the last one being a pituitary hormone). The levels of these hormones are tested to determine thyroid function and to detect hormone disorders but some of them continue to be retested at regular intervals, to monitor thyroid hormone replacement therapy as well. Thyroid patients who are better educated in regard to these hormones have better ability to be proactive in their treatments and communicate with their doctors so that they receive the best possible results from their hormone replacement therapies.
